

The Philips logo is displayed in a white rounded rectangle on a dark teal background. The word "PHILIPS" is written in a bold, blue, sans-serif font.The text "Smart Cities" is written in a white, sans-serif font on a dark teal background.The text "Smart parking" is written in a white, sans-serif font on a dark teal background.The main title "Smart cities initiative:" is written in a large, white, sans-serif font, positioned over a background image of a city skyline at sunset.The subtitle "Smart parking for better services" is written in a white, sans-serif font, positioned below the main title.The section header "Smart parking combines intelligent street lighting and integrated parking monitoring services" is written in a dark teal, sans-serif font.A paragraph of text in a dark teal, sans-serif font describing the current state of street parking infrastructure, noting its rudimentary nature and the challenges of accessing real-time data.A paragraph of text in a dark teal, sans-serif font detailing the Helsinki smart parking pilot, including its funding, partners, and the technology used to monitor parking spaces.A paragraph of text in a dark teal, sans-serif font explaining how the monitored data is used by third-party applications to help drivers find parking spaces and optimize utilization.The section header "Parking management potential" is written in a dark teal, sans-serif font.A paragraph of text in a dark teal, sans-serif font describing smart parking solutions, highlighting their recognition by cities for bringing benefits to citizens and the environment.

- 
- A bulleted list of benefits in a dark teal, sans-serif font, including reduced search time, traffic, emissions, and improved safety.

A small text note in a dark teal, sans-serif font citing the source as the San Francisco SFpark pilot project.

Unifying smart city services

Finding a parking spot quickly and easily is critical for both visitors and citizens. Studies have shown that 30% of the traffic congestion in cities is caused by drivers spending time searching for a parking spot*, and expediting this search will lower the levels of air pollution and traffic noise, while also cutting down on illegal parking and possibly helping cities determine a dynamic pricing structure based on use and occupancy data.

Continuous tracking of parking space utilization helps identify parking bottlenecks and offers a means to enable traffic guidance. In the future, outdoor luminaires could provide light indications, making it easy to identify open parking places on city streets.

Parking monitoring solutions interact with the connected lighting infrastructure to provide parking occupancy information to the location-aware lighting network. The real-time information is provided via data-dashboards tailored to the needs of the various stakeholders. The pilot deployment provides parking occupancy information to city authorities and city users via a public dashboard.

Smart city innovation pilot in Helsinki

A smart-parking pilot that uses IP-cameras and cloud-based image analytics is currently helping Helsinki discover the suitability of advanced lighting and video technology to address smart city challenges. Within the EIT-Digital open-innovation program, Philips Lighting Research collaborated with the Public Works Department of the City of Helsinki to co-create a smart parking service. This smart city innovation pilot allows the city to gain valuable insights into the feasibility of deploying these technologies on a larger scale. During February and March 2017, a small-scale smart parking pilot was deployed as part of Helsinki's open street-lab initiative, City as a development platform. Prior to the pilot, the smart parking concept had also been trialed at the High Tech Campus Living Lab in Eindhoven, during June to December 2016.

This smart city initiative has provided Helsinki with first-hand information about the suitability of video technology for this task and helped the city gain valuable insights into how this type of monitoring can be deployed. The concept has helped Helsinki move towards its goal of becoming a 'City as development platform' by providing insight into business models and innovative ways of utilizing its existing lighting network assets as a backbone for IoT applications.

Helsinki's innovation procurement program is now considering public lighting as a potential IoT backbone, enabling future smart city applications. The city is targeting further innovative third-party solutions and services for transport, based on comprehensive real-time understanding of traffic volumes, travel times and related conditions such as parking.

“

Cities recognize the need for open, scalable, connected platforms to harness the potential of the Internet of Things. Activities like this smart parking pilot help us **bring our innovations from the lab into our smart city ecosystems and explore the opportunities of connected lighting beyond illumination with cities.**”

Ruben Rajagopalan
